

The persona engine, on one page

V2 stateful simulation | A persona defines the person and policy. The engine interprets, governs, speaks, and remembers.

WHAT YOU DEFINE PER PERSONA

Identity and delivery

Description, goal, style, boundaries, private motivation, and named emotions shape the person. Reactions name phases. Actions define completed findings and their visible labels. Voice choice and voice enabled control audio, not reasoning.

Vocabulary and guidance

Events name recognizable situations. Allowed actions, goal progress, and persistence constrain outcomes. Principles and optional examples guide interpretation; executable routes and transitions govern state.

Memory and movement

State tracks define initial states and event-gated transitions. Fact classifications and capacity define retained evidence. Emotion transitions define intensity, carry/decay, and triggers.

Routes and response

Routes match events and required track states; priority selects one outcome, phase, intent, support text, and closing signal. Shared agency policy tempers that move through affect and supplies reply shapes; older profiles can define response forms.

Optional offers

Offer fields and scopes keep separate proposals separate. Explicit set, supersede, and retract operations change terms; expiry can age them out. Risk rules derive supplier duties, permitted persona contributions, and prerequisites for acceptance.

Case settings are separate

The case supplies scenario facts/rules and the planner/speaker models. Persona temperature overrides apply only to supported models. Engine mode chooses V2 or the preserved legacy path.

WHAT ONE TURN DOES

1 Admit the turn

Input: participant text or a configured completed action, chat and request identity.

Load: persona + case + saved history + current state. Verify ownership, case/action identity, and both models. A completed request returns its saved response immediately.

2 Interpret / planner model

Input: current evidence, history, persona/case context, policy, prior memory, typed schema.

Output: sparse event labels, fact selections, and explicit scoped offer changes with exact quotes; shared agency also admits an affect selection (emotion, target, intensity). These are proposed interpretations. The backend assigns source-turn metadata.

3 Govern / shared backend

Input: planner records + configured rules + prior state.

Validate IDs, quotes, sources, and legal operations. Update candidate facts/offers, advance tracks, resolve emotion and risk, and select the executable route/reply shape. Output: candidate next state plus the supported speaking outcome.

4 Speak / speaker model

Input: persona voice/style, history, selected route, supported facts, current emotion, and response slots.

Output: the visible reply in those slots. Shared human defaults favor a salient thought, ordinary language, and persona-specific firmness. The backend validates structure; factual meaning still requires model fidelity and transcript review.

5 Publish and return

Input: validated reply + candidate state + voice setting.

Voice off skips TTS; voice on attempts audio. One chat-document update publishes next state and the complete response pair; idempotent projections finish journal/history storage. Output: text, optional audio, state signals, and exact saved transcript.

6 Carry the conversation

Input to the next turn: published history, tracks, facts, scoped offers, emotion, and revision.

Each conversation keeps its persona snapshot; persona edits apply to new conversations. Published memory advances within this chat. Replaying a completed request adds no model calls or rows. Ambiguous provider outcomes return an error instead of automatic regeneration.

Shared V2 engine: evidence checks, rule execution, human-speaking instructions, model parameters, publication, and replay. Persona policy: vocabulary, motives, transitions, routes, and optional offer requirements.

Adrian can review a two-store pilot without approving a wider launch. The pilot needs its own terms and state; a separate supply agreement cannot satisfy them. The transcript shows his actual words.
